

MODULAR RUN-OF-RIVER HYDROPOWER TECHNOLOGY

Investment Opportunity

Building a New Approach to Sustainable Hydropower

The patented modular run-of-river hydropower technology developed by Iusup Tekhiev explores an alternative approach to renewable electricity generation. The concept is designed to generate electricity from natural river flows using a modular architecture intended to simplify deployment while supporting sustainable energy production. The project is currently seeking strategic partners to advance prototype development, engineering validation, and commercialization.

The Challenge

Hydropower is one of the world's most reliable renewable energy sources. Conventional hydroelectric projects often require significant civil engineering works, substantial capital investment, and long development timelines. Growing demand for clean energy creates interest in solutions that may reduce infrastructure complexity while maintaining the benefits of renewable power generation.

The Solution

The proposed technology investigates a modular run-of-river system intended to operate without the large infrastructure commonly associated with traditional hydroelectric facilities. Its modular architecture is designed to support flexible deployment and future scalability.

Key Advantages

- Patented Technology (RU2413866)
- Modular Architecture
- Run-of-River Concept
- Renewable Energy Focus
- Designed for Scalable Deployment
- Opportunity for Early Strategic Partnership

Current Status

- ✓ Patent granted
- ✓ Engineering concept completed
- ✓ Public project website launched
- ✓ Investor materials available upon request

- ✓ Seeking partners for prototype development and commercialization

Partnership Opportunity

Seeking strategic investors, engineering partners, prototype development partners, manufacturing partners, and commercialization & licensing partners.
